

**METHODS AND SYSTEMS FOR AUTOMATIC TRACKING
AND BALANCING BILLING DATA**

5

ABSTRACT OF THE DISCLOSURE

The present invention is a method and system of automatically tracking and balancing account receivable data transmitted to a processing entity by a service provider. The processing entity tracks the accounts receivable data by separating individual customer account records into tracking data sets based on pre-defined criteria. The processing entity computes the total amount of accounts receivable located in each tracking data set related to a given service provider. The total amount of pre-processed accounts receivable related to a given service provider is compared to the total amount of processed accounts receivable related to the service provider. The invention further comprises creating reports based on the results of the comparison test to inform the processing entity of tracking or processing errors.
